SUMMARY

Data scientist with 2 years of experience building predictive models and self serve reporting for a consumer subscription product. Comfortable owning a problem end to end, from pulling the data in SQL through to presenting results to product managers. Looking for a role with more depth in production machine learning.

SKILLS

Python, SQL, pandas, NumPy, scikit-learn, statsmodels, Tableau, Looker, Git, Jupyter, Airflow, dbt, A/B testing, experimental design, regression analysis

EXPERIENCE

Junior Data Scientist, Northwind Analytics, San Francisco (2024 - Present)

- Built a churn prediction model in scikit-learn that improved retention campaign targeting by 12% and is now retrained monthly on 1.2M subscriber records.
- Wrote and maintained 14 SQL transformation models in dbt feeding three executive Tableau dashboards reviewed weekly by the leadership team.
- Designed and analysed 8 A/B tests on onboarding flows, including power analysis and sample size calculations, and presented results to product managers.
- Reduced a nightly reporting job from 40 minutes to 9 minutes by rewriting three correlated subqueries as window functions.
- Built an anomaly alert in Python that flags unexpected signup drops, catching two payment integration outages before support tickets arrived.
- Mentored one summer intern through their first production dashboard.

Data Science Intern, Northwind Analytics, San Francisco (2023 - 2024)

- Cleaned and validated a 400,000 row customer dataset, documenting 11 recurring data quality issues that were later fixed upstream.
- Built the company's first cohort retention report, still used by the growth team.
- Automated a weekly KPI email that had previously been assembled by hand in Excel.

Undergraduate Research Assistant, UC Davis Statistics Department (2022 - 2023)

- Ran simulation studies in R comparing three variance estimation methods.
- Co-authored a poster presented at the departmental research symposium.

PROJECTS

Transit Delay Predictor - Trained a gradient boosting model on two years of public transit data to predict bus arrival delays, deployed as a small Flask API.

Grocery Price Tracker - Built a scheduled Python scraper and Streamlit dashboard tracking price changes across 200 supermarket items.

EDUCATION

BS Statistics, University of California Davis (2023)

Relevant coursework: statistical learning, Bayesian inference, linear models, database systems. GPA 3.7.

CERTIFICATIONS

Google Data Analytics Professional Certificate (2023)

Tableau Desktop Specialist (2024)
